TEPS TO SOLVE THE ERRORS IN THE CODE

The original code had 7 errors. Here are the steps to fix them:

Step 1: Fix the variable name in the if condition (Line 6)

- Error: if event in event
- Fix: if event in events
- Reason: The code should check if the input event exists in the 'events' list, not in itself.

Step 2: Add colon after the if condition (Line 6)

- Error: if event in events (no colon)
- Fix: if event in events:
- Reason: In Python, colons are required after if statements.

Step 3: Add indentation before participants.append (Line 7)

- Error: participants.append(name) (no indentation)
- Fix: participants.append(name) (add 4 spaces)
- Reason: The code inside an if block must be indented.

Step 4: Add colon after else statement (Line 9)

- Error: else (no colon)
- Fix: else:
- Reason: In Python, colons are required after else statements.

Step 5: Fix the variable case sensitivity (Line 12)

- Error: `print("Event:", Event)`
- Fix: `print("Event:", event)`
- Reason: Python is case-sensitive. 'Event' was not defined, only 'event' was.

Step 6: Add colon after for loop (Line 13)

- Error: `for i in range(3)` (no colon)
- Fix: `for i in range(3):`
- Reason: In Python, colons are required after for statements.

Step 7: Add indentation before `print("Registered")` (Line 14)

- Error: `print("Registered")` (no indentation)
- Fix: `print("Registered")` (add 4 spaces)
- Reason: The code inside a for loop must be indented.

SUMMARY OF CORRECTIONS:

- Line 6: Changed `"if event in event"` to `"if event in events:"`
- Line 7: Added indentation before `"participants.append(name)"`
- Line 9: Added colon after `"else"`
- Line 12: Changed `"Event"` to `"event"`
- Line 13: Added colon after `"for i in range(3)"`
- Line 14: Added indentation before `"print("Registered")"`
